

React To-Do List

This challenge is designed to test your react skills in making components, mapping data out, managing your state and receiving user input.

You need to create a To-do List application that has the following features:

- Add items to the list
- Check items as done
- Delete individual items from the list

Visually this project is completely down to your choice! Get creative and have a look around at existing to-do list applications and designs.

Stretch goals:

- Edit items
- Archive items from the main list into a secondary list. (Don't need to be saved to databases or anything mad)
